

PN: SS-BME680#I2C SKU: ITBP-6003

s-Sense by itbrainpower.net

BME680 I2C sensor breakout

Equipped with **BME680** - high performance, digital, 4-in-1 sensor with gas, humidity, pressure and temperature measurement based on proven sensing principles and having very low power consumption. BME680 sensor it's manufactured by Bosch Sensortec.

BME680 breakout features:

- *I2C interface, 3.3-5V auto* [default, the <u>I2C reference voltage follows the</u> power in voltage],
- *I2C reference voltage* option via solder jumper [Eg.: power at *5V and I2C at 3.3V*; power and *I2C at 2.2V*],
- alternative sensor I2C addresses via solder jumpers,
- power in with voltages between 3.3-5V [default],
- big soldering pads on 2.54 mm [0.1"] pitch for standard row header / connector,
- very light and slim 13x27mm, around 2grams,
- compatible with Arduino [all 3.3V and 5V], xyz-mIoT shields, Raspberry PI [all versions] and other SBC / MCU Arduino [Beagle Bone, Teensy, ...]
- Arduino C, Raspberry PI [Python] software support.

BME680 sensor features:

- ambient range for operation -40 ~ +85C, 0%-100% r.H., 300-1100hPa
- resolution of gas sensor resistance measurement 0.05-0.11%
- bVOC tolerance/certified accuracy 10-20% / 2-5%
- humidity accuracy +-3%
- absolute temperature (0-65C) accuracy +-1C
- absolute/relative pressure accuracy +-0.6hPa/+-0.12hPa

Designed and manufactured in EU by R&D Software Solutions.

BME680* breakout

gas, humidity, pressure and temperature – air quality sensor

PN: SS-BME680#I2C SKU: ITBP-6003

* BME680 digital sensor provided by Bosch

BME680 breakout :: INTERFACES, PADS and SOLDER JUMPERS

12C and POWERING INTERFACE

In the left edge of the top PCB side, top to bottom:

- 1. Vin POWER IN 3.3V / 5V (default) *
- 2. 3V3 Vdd LDO output (default) / LDO bypass IN **
- 3. SDA I2C SDA [default, pulled up at Vin]***
- 4. SCL I2C SCL [default, pullup up at Vin]***
- 5. GND POWER and I2C GROUND
- * Default, the I2C reference voltage follow the Vin voltage. If your board (Arduino/other) it's 5V compliant, connect +5V to Vin. Similar, for 3.3V compliant board (RPI/Arduino) connect 3.3V source to Vin.
- ** 3.3V voltage it's available on \underline{Vdd} PAD, if Vin it's connected to 5V. Bypass LDO see schema and read docs.
- *** Default, the I2C reference voltage follows the Vin voltage! Read bellow about I2C reference voltage and *s1* solder jumper.

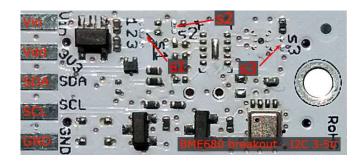

Image 1 – sensor top side

SOLDER JUMPERS

s1: I2C reference [Vin or 3V3-bypass], default Vin *

s2: RESERVED

s3: BME680 I2C address [0x76/0x77], default 0x76 *

SIGNALS INTERFACE and MARKING

In the left edge of the bottom PCB side, top to bottom:

- 8. RESERVED
- 9. RESERVED

nc. NOT CONNECTED

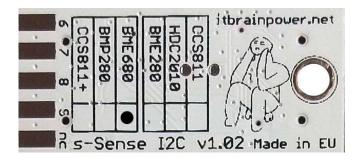

Image 2 – sensor bottom side

Observe the sensor breakout marking on PCB board (here, BME680 sensor it's marked as populated).

BME680 breakout :: Arduino / Raspberry PI basic interfacing

BME680 breakout	Arduino 5V [Eg.: UNO]	Arduino 3.3V [Eg.: Zero]	RPI [B/B+/II/3/3+/Zero/Zero W]
Vin PAD*	<i>5V</i>	3.3V	PIN1 (3.3V)
Vdd PAD (3V3)*	-	-	•
SDA PAD	SDA	SDA	PIN3 (SDA)
SCL PAD	SCL	SCL	PIN5 (SCL)
GND PAD	GND	GND	PIN9 (GND)

^{*} here, power in default mode (sensor & MCU power and I2C at same voltage!!). For alternate mode see solder jumper description bellow.

^{*} Read about s1 and s2 functionality bellow.

^{*} Taking a look at how-to posts and inside software examples may be quite helpful.

^{***} Default HIGH level.

BME680 breakout :: solder jumpers description; power scenarios

s1* - I2C reference voltage selector - shipped with circuit 1-2 closed and circuit 2-3 open (default mode).

In default mode, the I2C reference voltage follows the voltage applied to Vin! Default mode use cases:

- shield/MCU it's 5V compatible ==> connect Vin at 5V; the I2C reference it's 5V!
- SBC/shield/MCU it's 3.3V compatible ==>connect Vin at 3.3V; the I2C reference it's 3.3V!.

Alternate mode - <u>I2C reference voltage follows the Vdd voltage</u>! - modify *s1* as: 1-2 circuit open, 2-3 circuit closed [carefully interrupt/cut the circuit line between pads 1 and 2, and solder over pads 2 and 3].

Alternate mode scenarios:

- apply 3.6-7V to <u>Vin</u>. The I2C reference voltage it's set at 3.3V! Also, at <u>Vdd</u> pad (LDO output) 3.3V (up to 100mA) it's available for third part powering (anyway, try to keep the sunk current as low as possible, in order to avoid thermal errors).
- keep <u>Vin</u> not connected. Apply 2.8 or 3.3V to <u>Vdd</u> (the LDO it's bypassed). The I2C reference voltage it's set at voltage applied to <u>Vdd</u> pad!

s2 - RESERVED

s3 – **BME680 I2C address** - default circuit open, BME680 having 0x76 as I2C address. Solder over *s3* pads [circuit closed] in order to select the alternate I2C address [0x77].
